1. Change background colour and menus

Aim: build a web app where the user changes the background colour and the menu layout.

Method

- Colours are stored as a CSS variable and applied with one function.
- Foreground colour is chosen by luminance: `0.299R + 0.587G + 0.114B` above 150 uses dark text.
- Menu style toggles a class that switches flex direction.
